

Generation of AIRS Radiance Dataset for Climate Studies

Mitch Goldberg, Lihang Zhou

Satellite Meteorology and Climatology Division

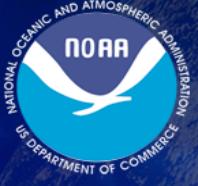

NOAA/NESDIS

March 27, 2007 AIRS Science Team Meeting

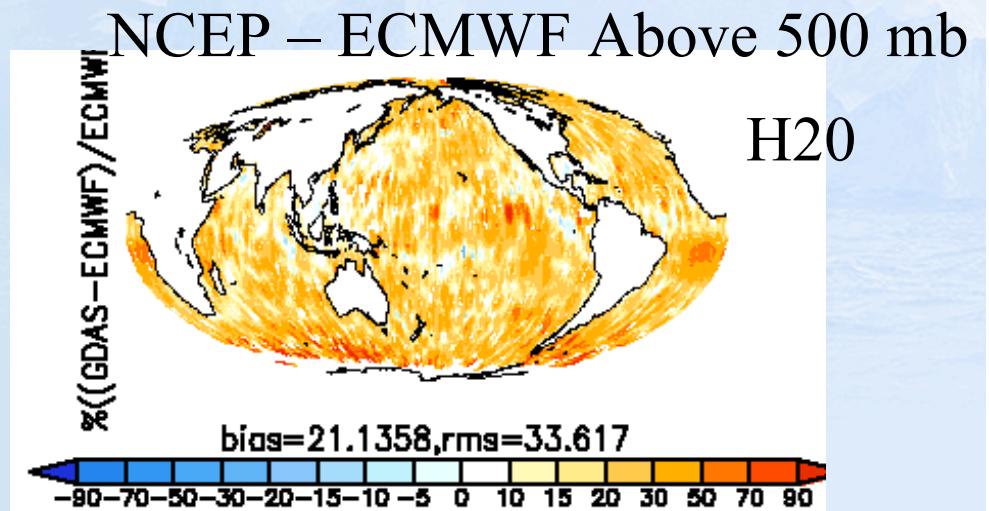

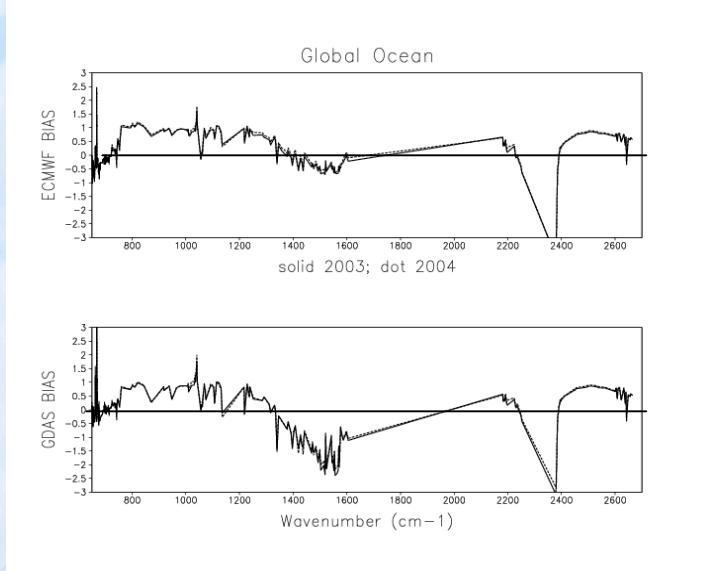

Background

- AIRS radiances are climate quality
- Key climate forcing, feedback and response variables are imbedded in AIRS
- Generate monthly maps of nadir angle adjusted AIRS radiances from our gridded datasets (single AIRS fov per 0.5 lon x 2.0 lat) for climate change detection and attribution and model validation

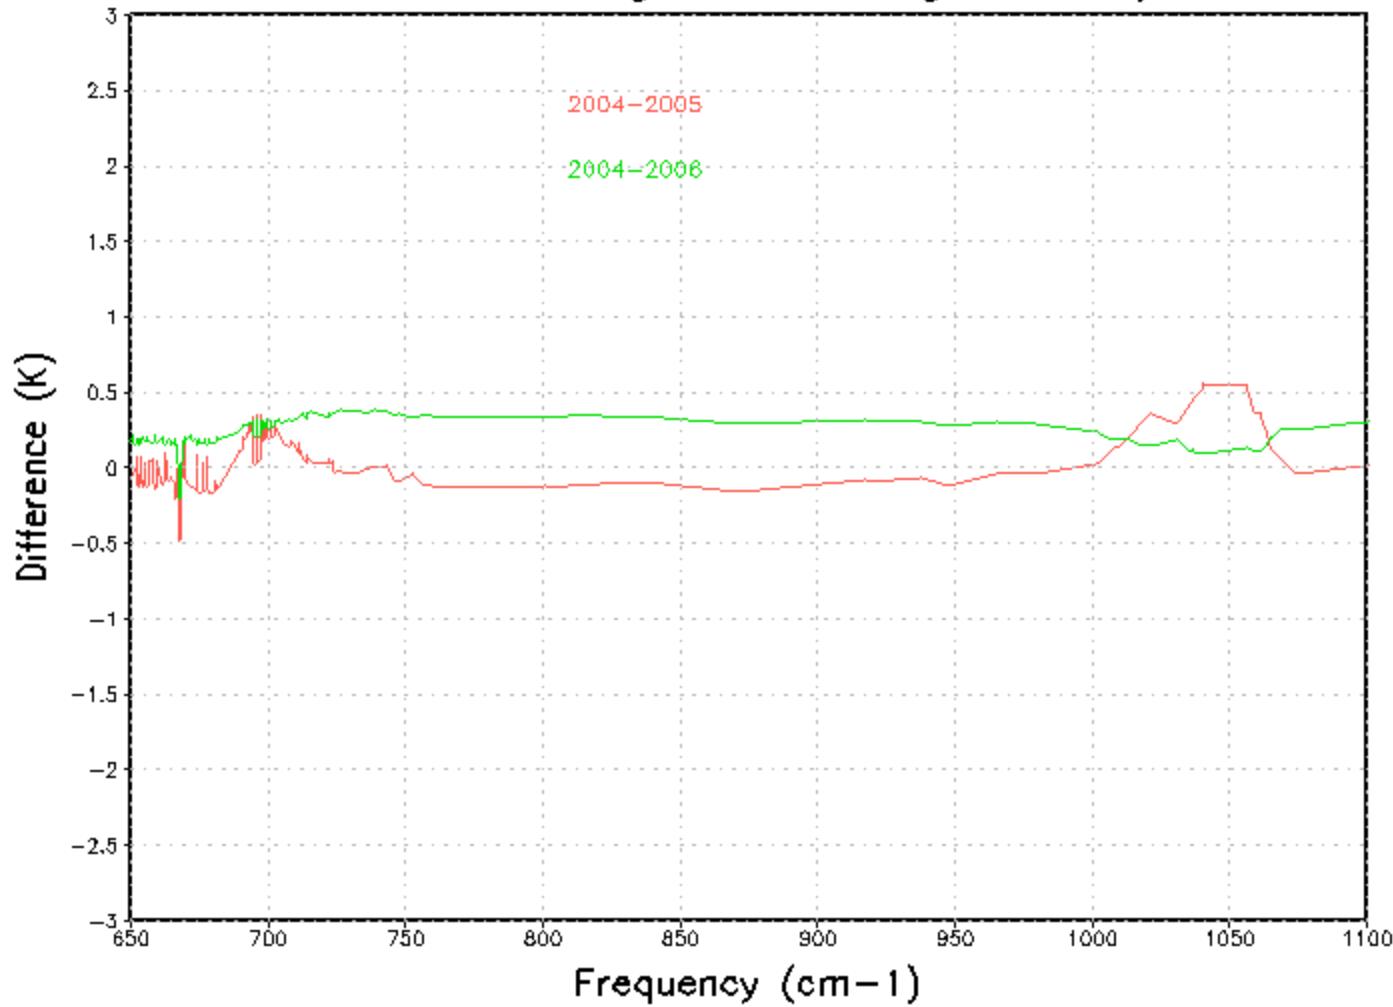

Applications of Mapped Spectrally Resolved Radiances

- Compare radiances with simulated radiances from model analyses
- Compare different years to see how the outgoing infrared radiances have changed.

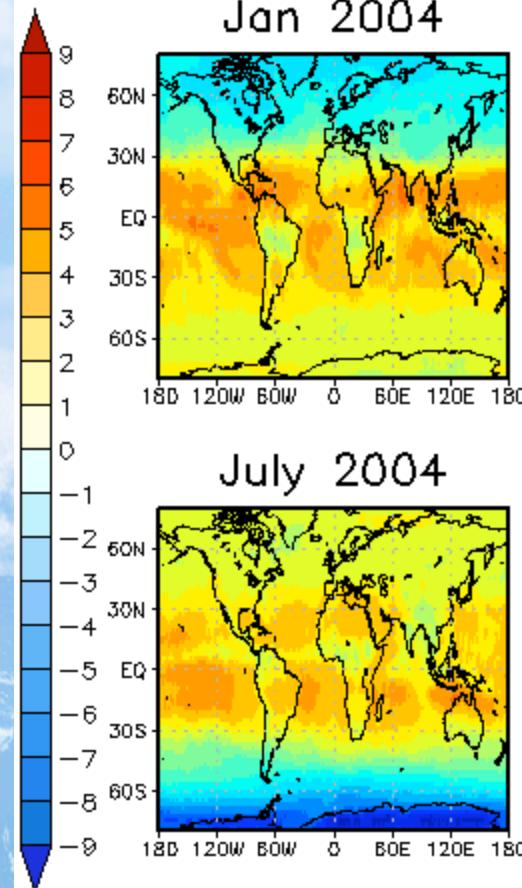

Global Average, Ascending, January

Ozone Loss

Normal ozone level: 300 Dobson units

Arctic trends scrutinized as chilly winter destroys ozone

Is climate change to blame for looming northern hole?

Quirin Schiermeier, Nature, 5/5/05

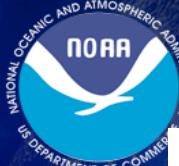

Today's Topics

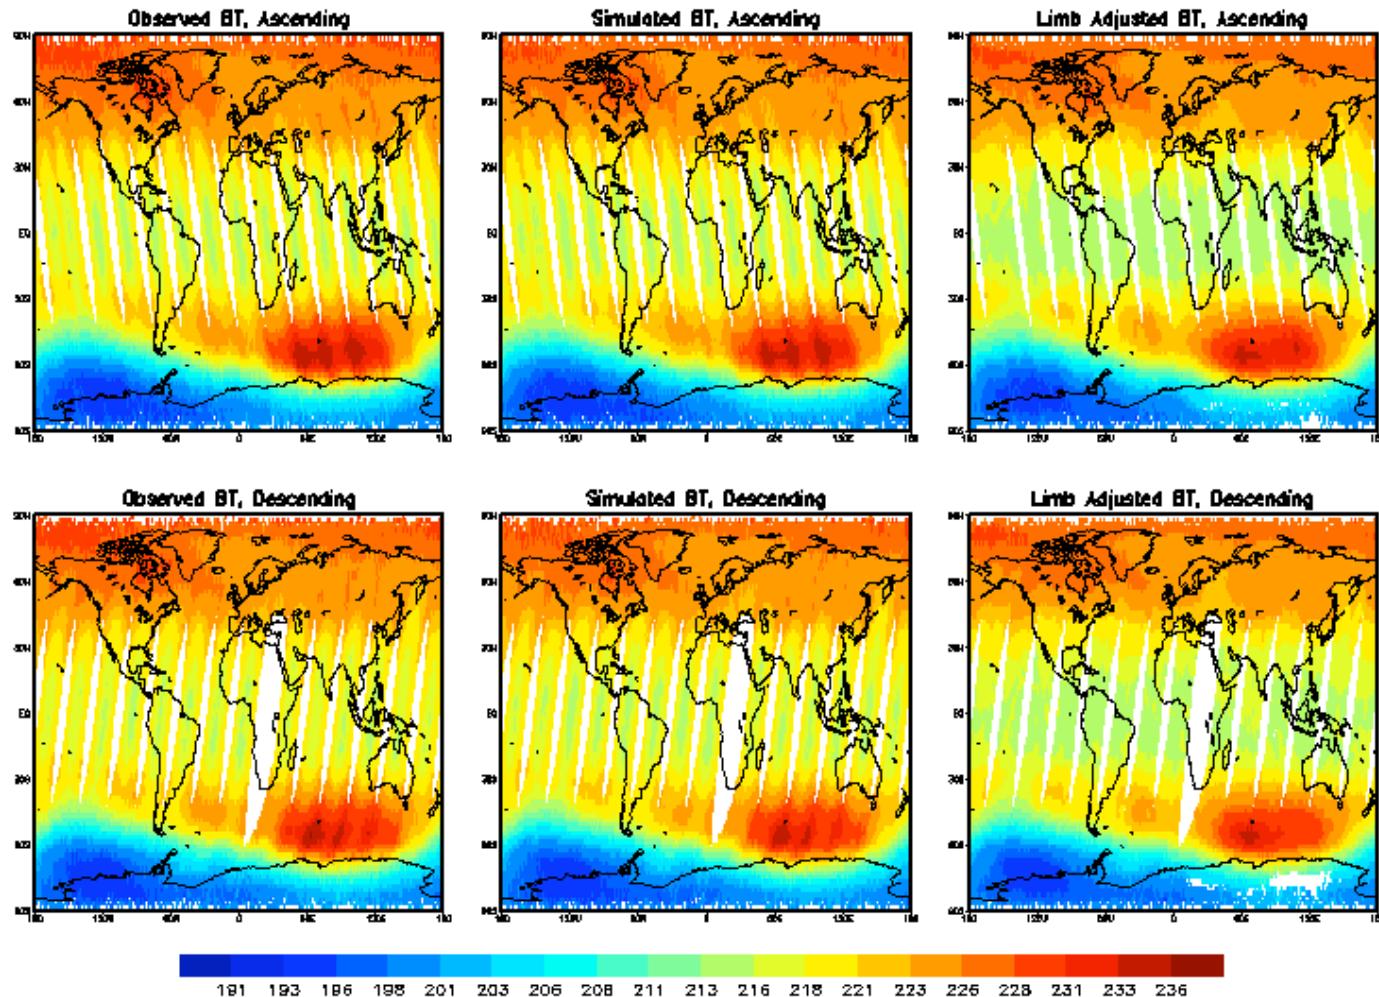

- Demonstrate the accuracy of the angle adjustment procedure and its importance
- Show comparisons with NCEP and ECMWF analyses
- Show some IASI PCA results and discuss importance of PCA for noise reduction

Accuracy

Summary

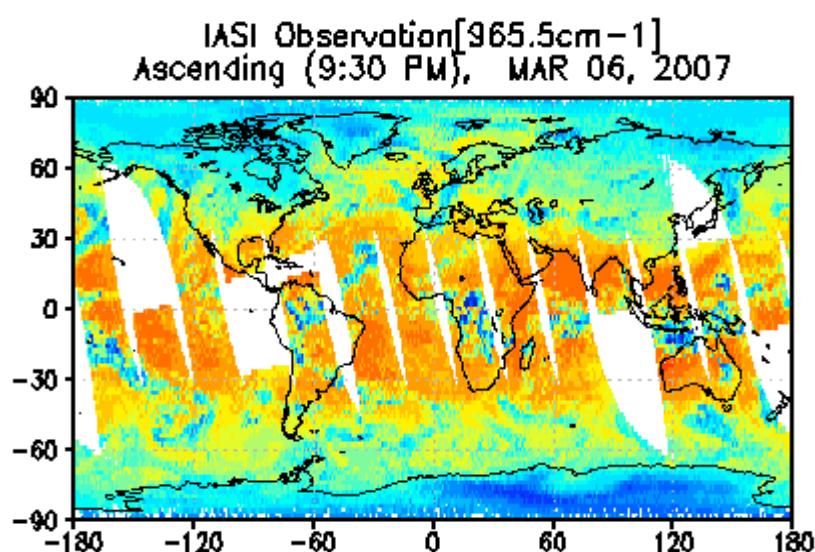

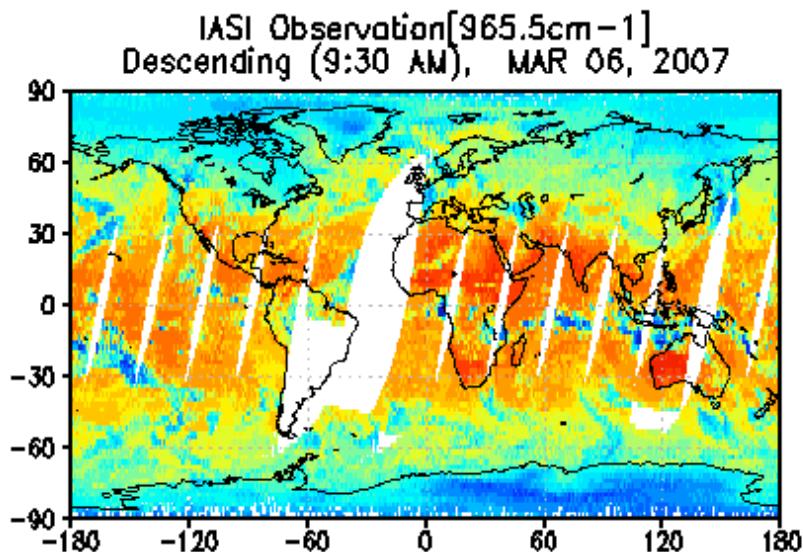

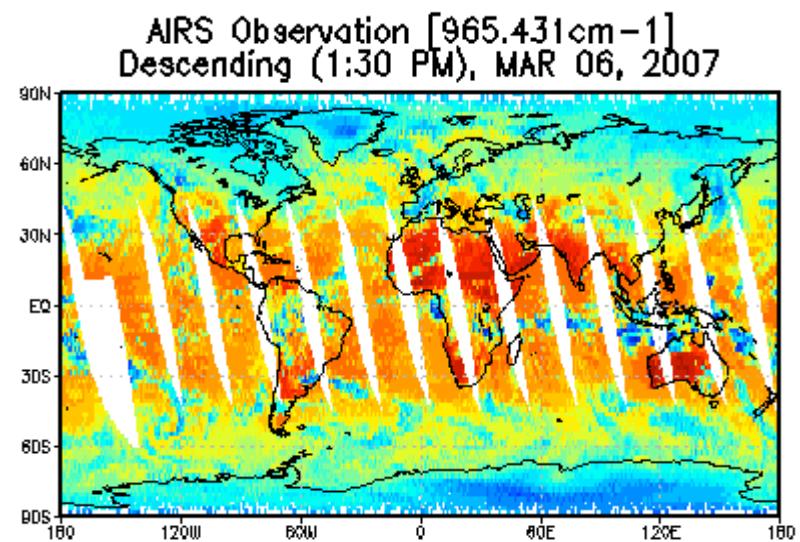

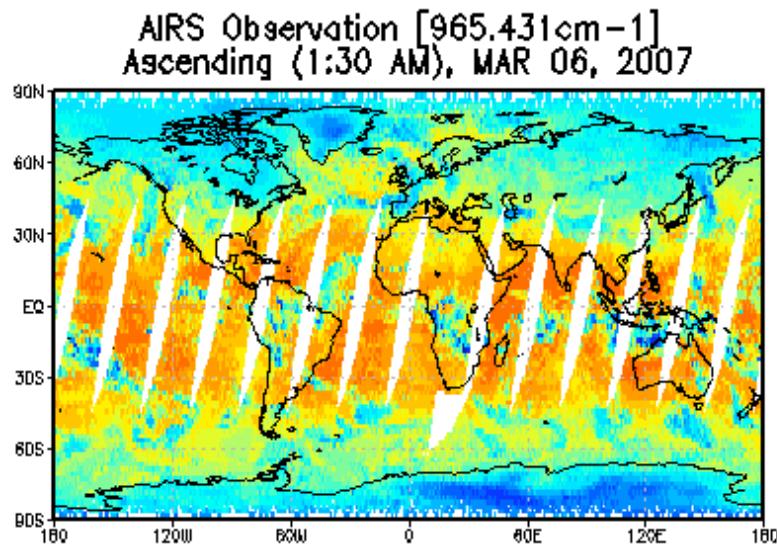

- Angle adjustment procedure is very accurate
- Need to angle adjust to provide robust global monthly maps without aliasing effects due to viewing geometry.
- Hence, a climate quality hyperspectral radiance (HR) dataset requires angle adjustment
- We will generate HR dataset from our daily gridded single fov datasets
- Once validated and published, we would like to provide code and coefficients for future full resolution reprocessing @GSFC.

IASI Update

Mitch Goldberg, Chris Barnet, Zhaozhi Cheng, Lihang Zhou, Walter Wolf, Tom King, Murty Divakarla, and many more....

NESDIS is now receiving IASI data in real time

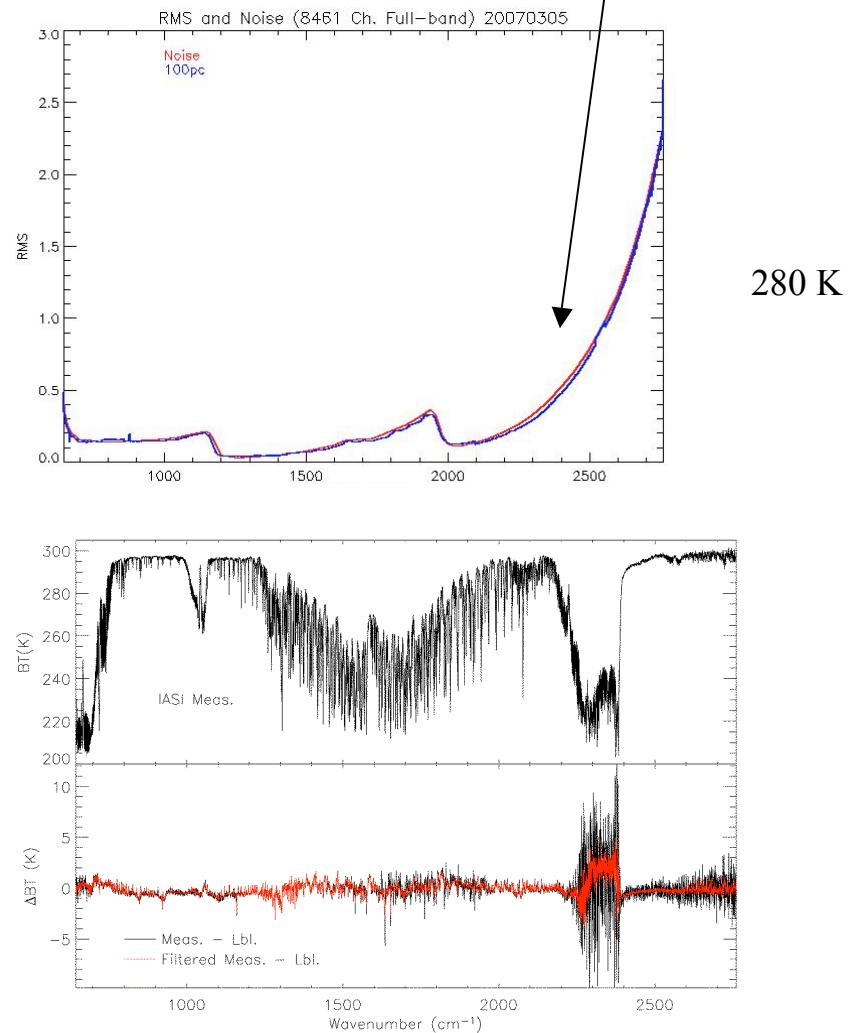

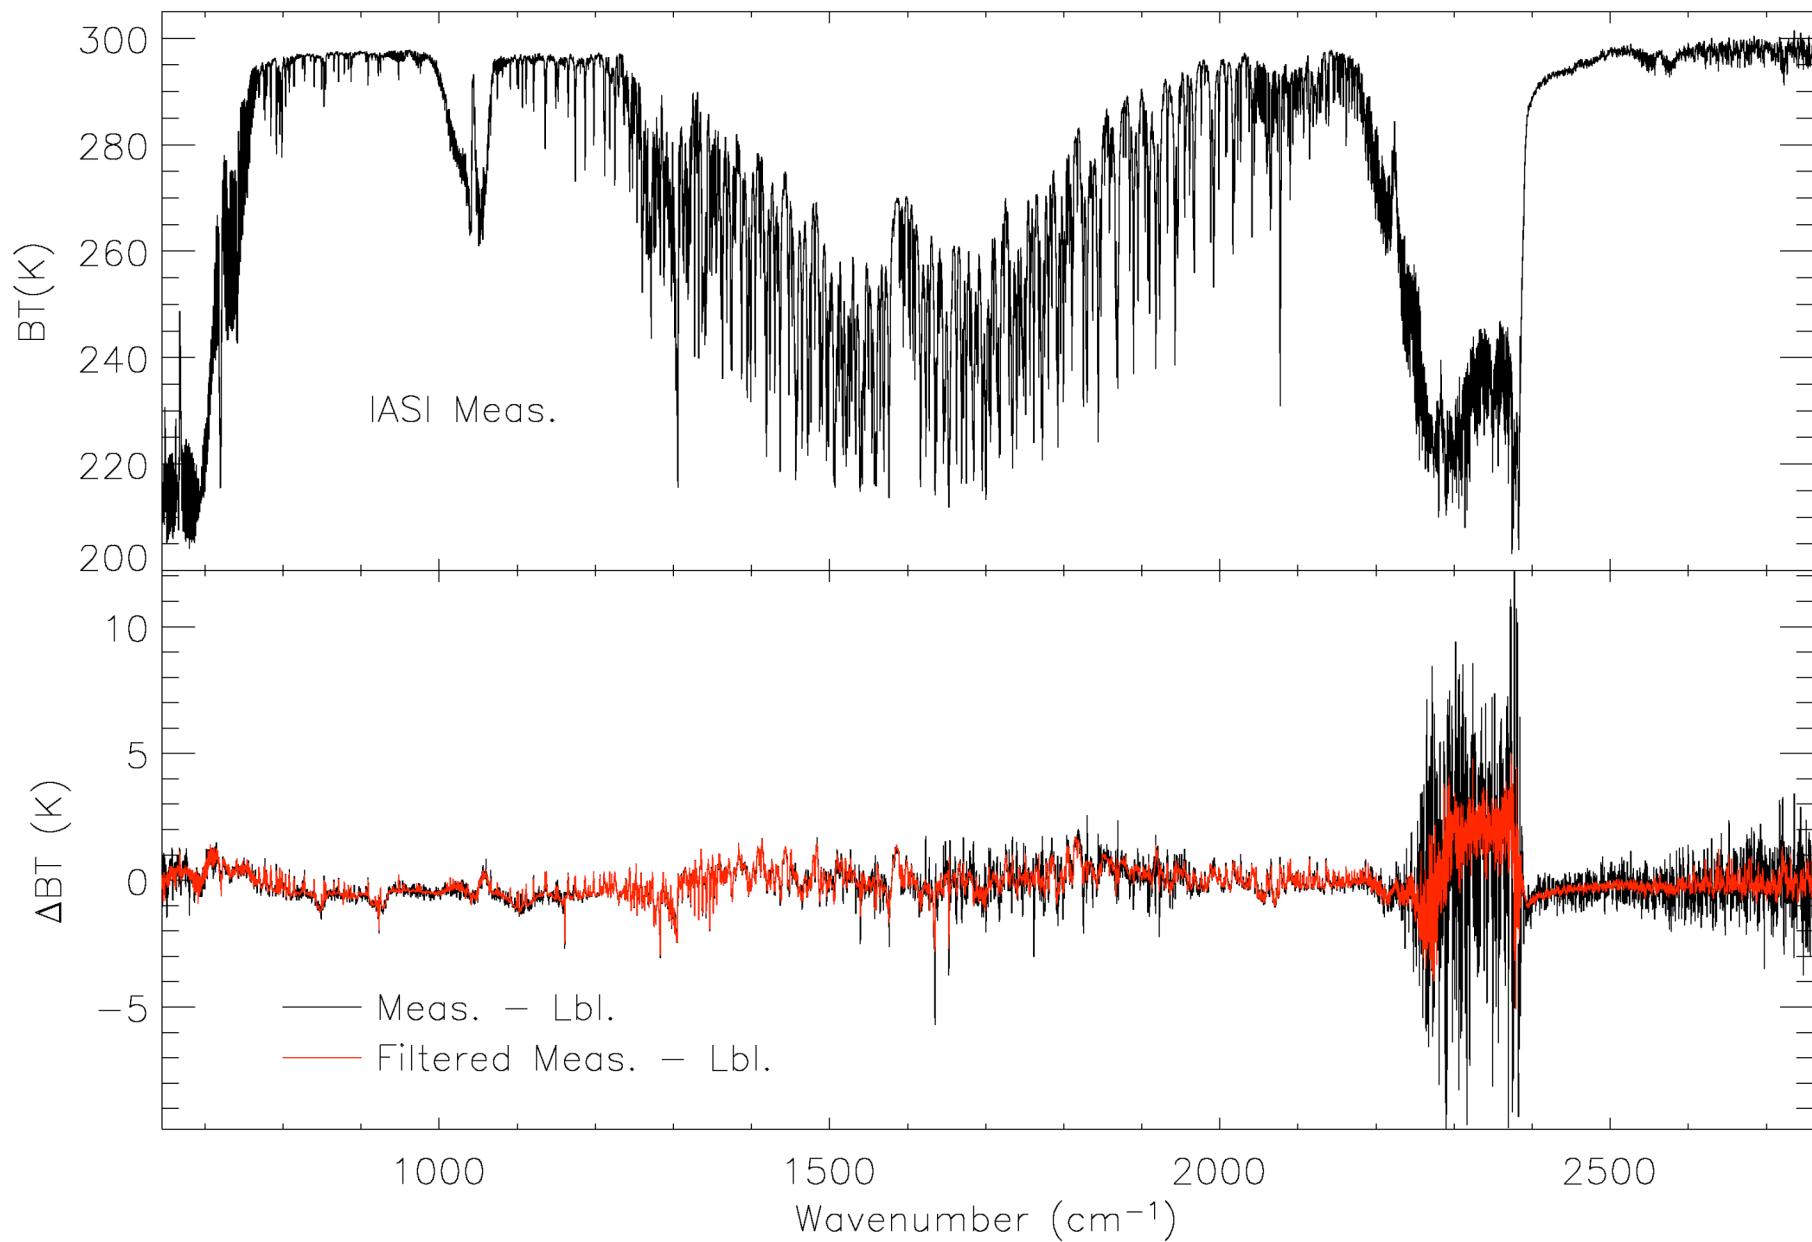

Comparison of AIRS and IASI (IASI instrument developed by CNES)

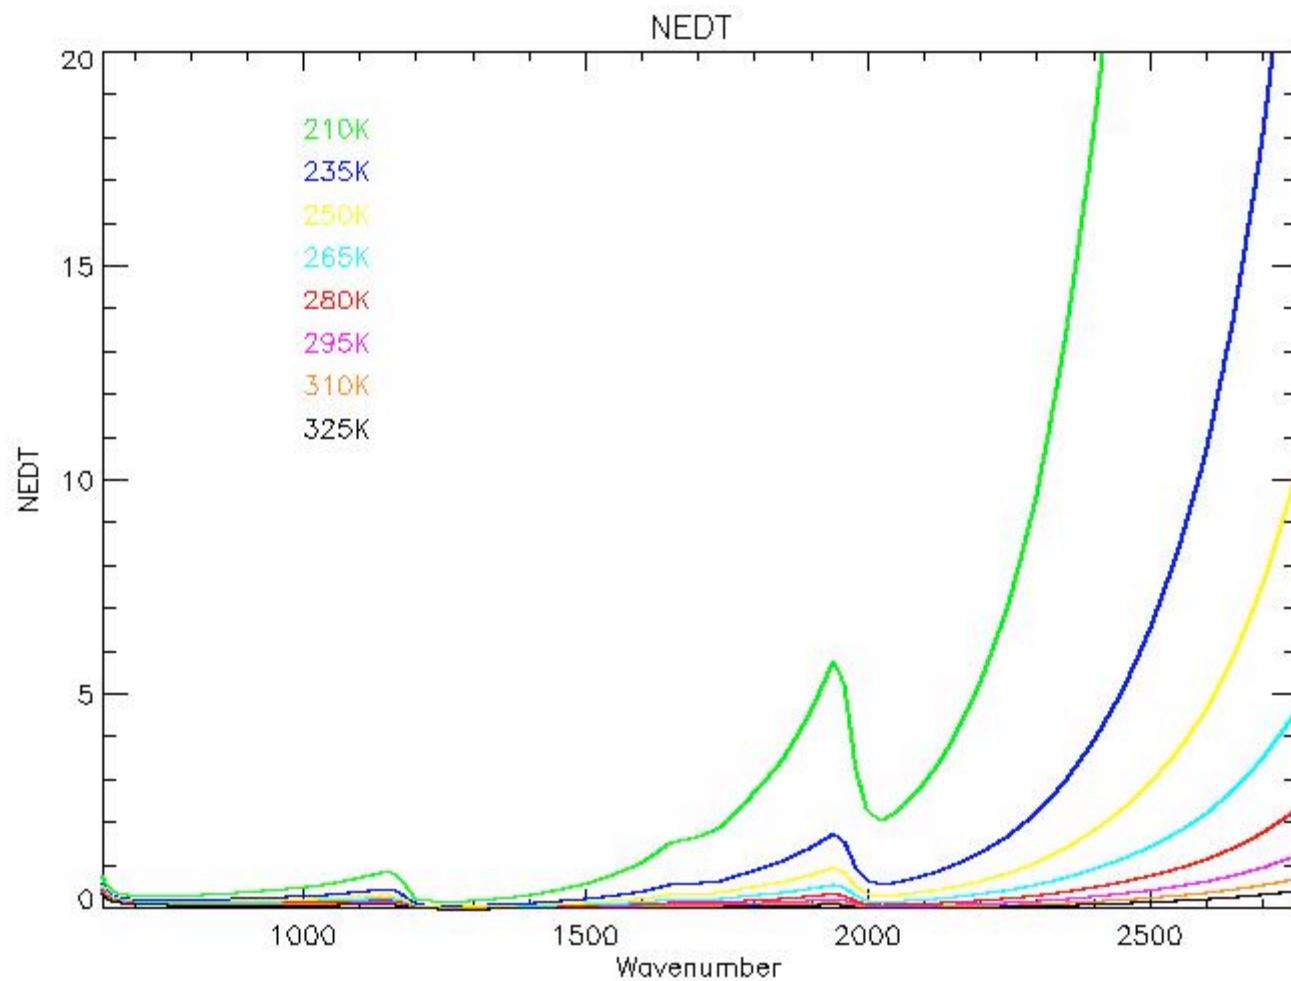

Eigenvector Analysis for Noise Reduction

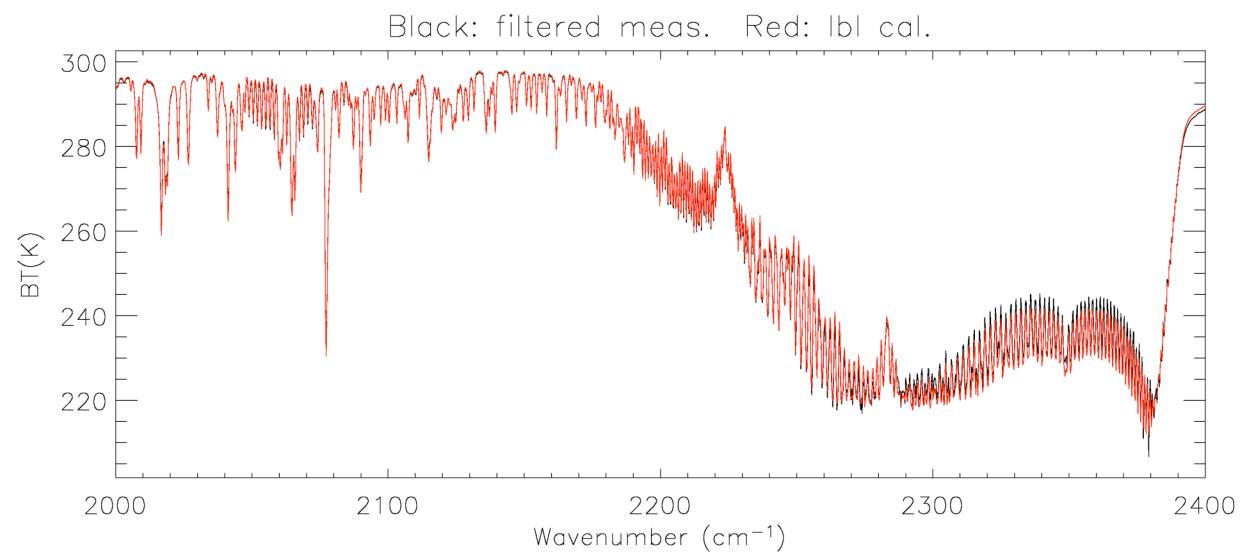

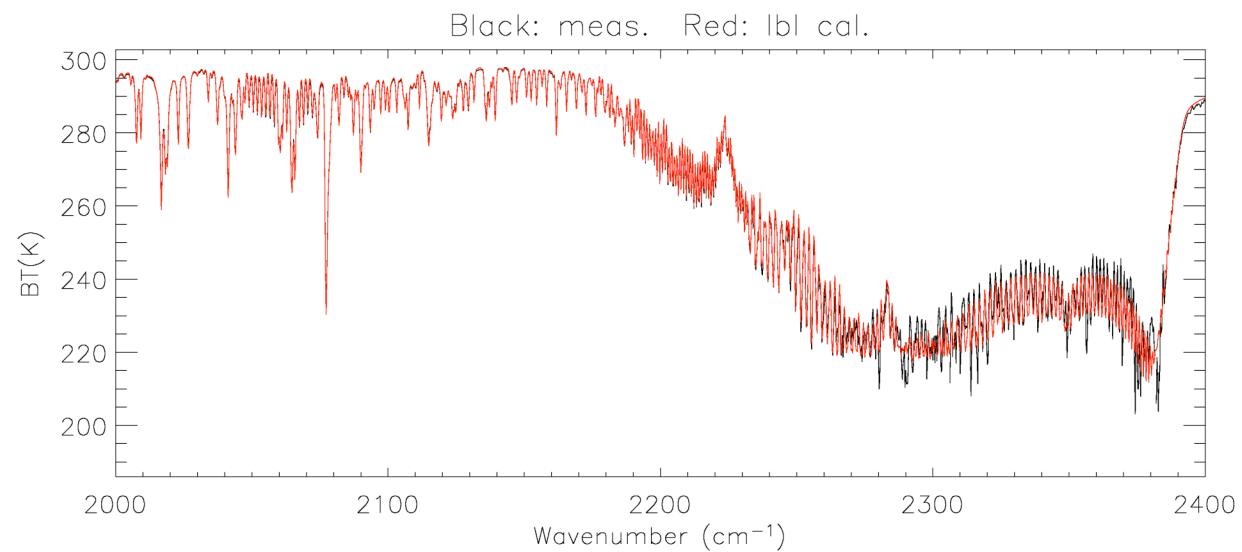

- Eigenvector analysis allows correlated data to be represented by a relatively small set of functions.
- 8461 channels can easily be represented by a 100 unique coefficients couples with 100 static structure functions (100×8461)
- Benefits: Noise filtering and data compression. Distribute and archive 100 coefficients instead of 8461 channels (lossy compression)
We can now use shortwave IR window channels for applications (LW vs SW cloud tests)

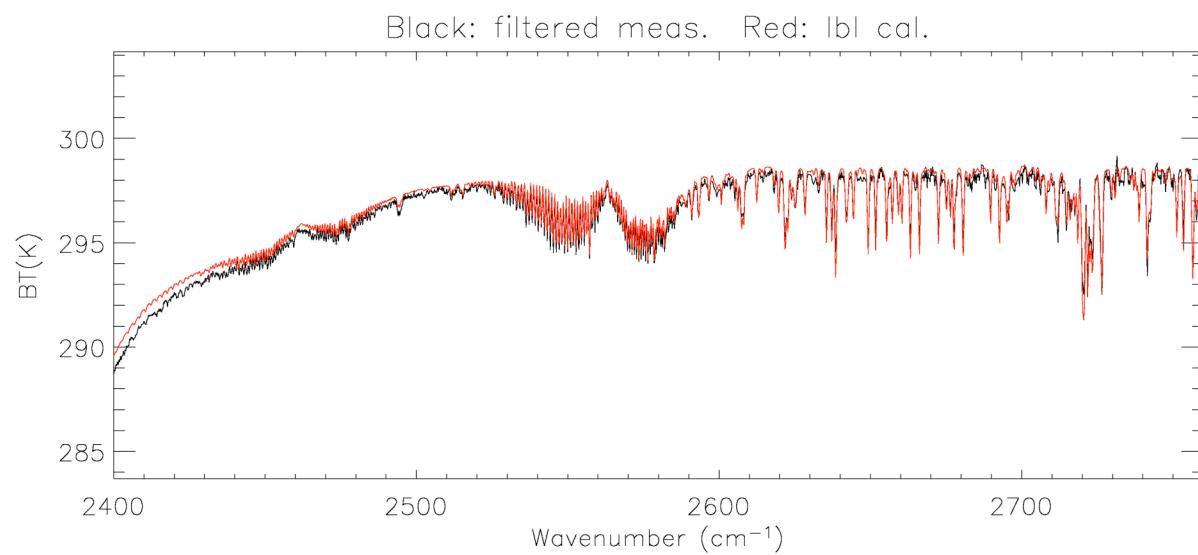

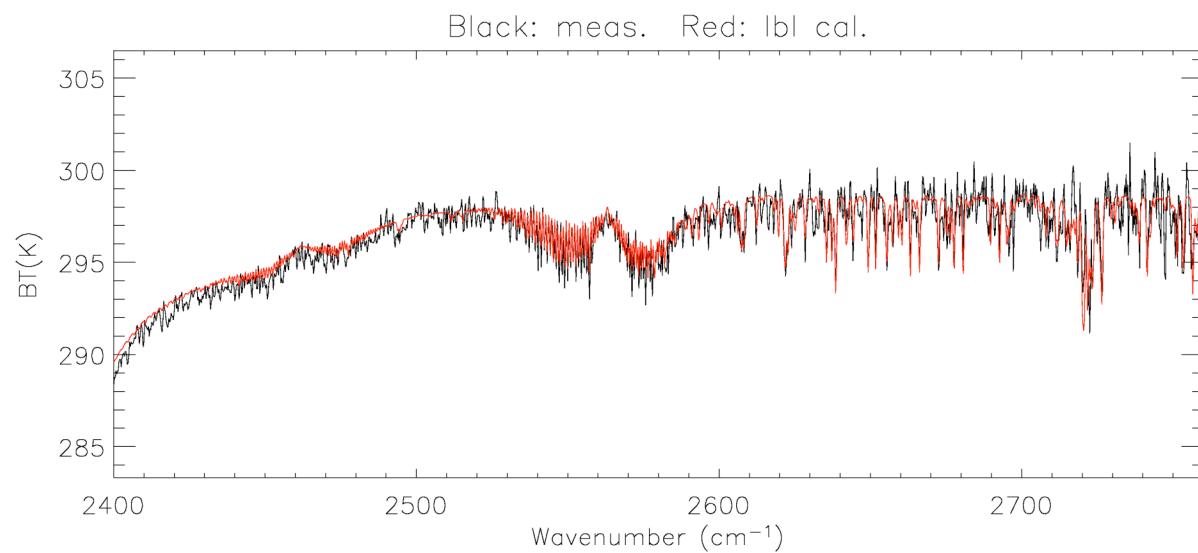

Independent assessment of noise from root mean Square difference between measured and reconstructed noise.
The reconstructed radiances are noise filtered, therefore the rms matches the instrument noise

ascending

Descending, sample=50381, std=2.63183
bias=-0.149342, rmse=2.63609, nedt=1.1752

Summary

- Must use PCA to filter high noise IASI data.
- Reconstructed – original radiance will provide a very accurate single fov noise estimate.
